Joannes Figueroa

Full Stack Software Engineer

TECHNICAL SKILLS

Spoken Languages: English, Spanish
Programming Languages: TypeScript, JavaScript (ES6), Python, Ruby, SQL, HTML, CSS, Spanish
Frameworks & Libraries: React.js, Next.js, Node.js, Express.js, Flask, React Testing Library, Jest, Unittest, Tailwind, MUI, Socket.IO
Databases: PostgreSQL, SQLAlchemy, Supabase
AWS: EC2, S3, CloudFront, CodeBuild, CloudWatch, CloudTrail, Route 53, IAM, Amazon RDS, VPC
Tools & Strategies: Git, GitHub, Slack, Asana, LLMs, Agile, CI/CD, Cloud Computing, AI agent(AWS Bedrock, Strands), Tavily

EXPERIENCE

Software Engineer — Freelance Apr 2024 – Present
Oakland, CA

- Designed, built, and shipped a full stack application, in production with local businesses (beta), owning every layer from concept to production: a React/TypeScript front end, a Python/PostgreSQL back end.
- Implemented microservice architecture to facilitate client requests and database management boosting code maintainability.
- Optimized users experience with intuitive, custom built, user-facing React features.
- Implemented real-time communication features with WebSockets (Socket.IO), enabling live updates and messaging between concurrent logged-in clients.
- Constructed and deployed a custom AWS suite to run a high-availability full stack application, improving performance, security, and maintainability.

Practicum Lead / Mentor — Code The Dream Sep 2023 – Present
Remote

- Lead and mentor cohorts of student engineers through month-long React projects, guiding teams from planning through delivery across Git, GitHub, and Slack.
- Uphold coding standards through comprehensive code reviews while managing Agile task delegation for high-quality, on-time delivery.
- Coach engineers on core professional skills: debugging, troubleshooting, version control, and effective research methods, accelerating their growth and collaboration.

Software Engineer — Pantry Aug 2022 – Sep 2023
Emeryville, CA

- Designed a polished, responsive UI/UX with React and Tailwind, elevating the product's visual quality.
- Overhauled the JavaScript codebase to TypeScript, improving reliability, maintainability, and developer productivity.
- Architected React components with a loosely coupled, modular pattern for improved scalability.
- Conducted thorough code reviews that reduced bug-related issues by 40%, ensuring high-quality production features.

Software Engineer Intern — Numbers API May 2022 – Jun 2022
San Francisco, CA

- Converted Node.js services to Flask, enforcing RESTful endpoints and DRY principles for better maintainability and scalability.
- Modeled data tables with SQLAlchemy, backed by Jest tests, ensuring reliable functionality.
- Refactored a legacy codebase to an MVC pattern with comprehensive documentation, streamlining collaborative development.

EDUCATION

Rithm School — Full Stack Web Development Mar 2022 – Jun 2022
San Francisco, CA

PROJECTS

Job Search Agent — Python, AI agent(**AWS Bedrock, Strands**), **Tavily**(Agent tool) - GitHub
Built with Claude as a pair programmer; I set the direction, made the design decisions, tested every stage, and graded the results.

- Built an AI job-search agent that interprets a plain-English request, picks companies to search, reads each posting, and ranks listings against a résumé with cited evidence.
- Redesigned an early version that hallucinated qualifications: Python now fetches full postings directly from company job boards, so the AI only ever reads real text.
- Split the work so the AI makes only judgment calls (what a posting asks for, whether a résumé meets it) and Python does everything else: fetching, verifying, scoring, ranking. Cut a typical search from 16 AI steps to 3–4.
- Built a hand-graded test set of 15 postings to measure extraction and matching accuracy, and used it to drive prompt and policy fixes.
- Added an automatic check that rejects any AI claim it can't point to in the source text, so fabrication can't reach the results.
